Optimized Thermal S Y S T E M S

Who are we?

Serving the HVAC&R industry through cutting edge research, state-of-the-art software, and performance measurements and verification new technologies that can reduce energy consumption and address growing environmental concerns.

Copper Development Association Inc.

Defend and grow markets for copper based on its superior technical performance and its contribution to a higher quality of life worldwide. Members include copper mining and fabricating companies

Test Coils (Purdue Paper Recap)

- Flat/plate fins
- Coils designed for equivalent performance: similar face and heat transfer area
- Actual coils fabricated differently from design specifications
- Frost tested coils: similar face area and surface area 3mm has higher capacity and pressure drop!

D. Bacellar et al., "Design Optimization of 3mm and 5mm Copper Tube and Flat Fin Air-to-Water Heat Exchangers with Experimental Validation" presented to International Refrigeration and Air Conditioning Conference at Purdue, May 24-28, 2021.

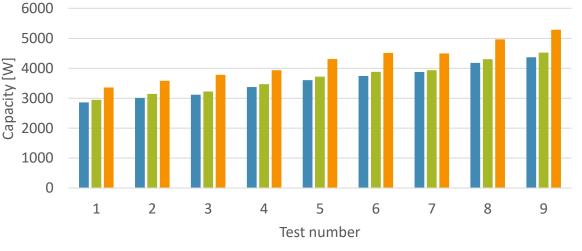

This document contains information proprietary to Optimized Thermal Systems, Inc. (OTS). This document and the contained information cannot be used, copied, transmitted, in full or in part, without prior written authorization of OTS.

Optimized Thermal

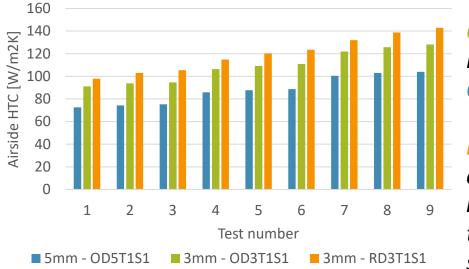

3mm vs. 5mm Coils (Dry Tests)

3mm OD designs achieve *higher capacity* than *5mm* at the same test conditions:

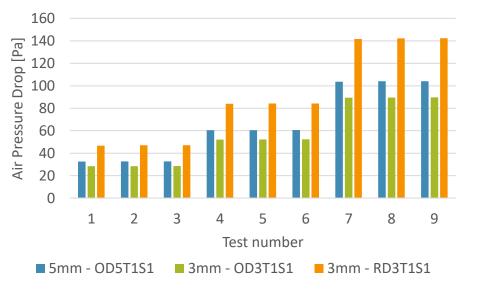

■ 5mm - OD5T1S1 ■ 3mm - OD3T1S1 ■ 3mm - RD3T1S1

OD3 has better capacity, HTC, and lower ΔP than OD5

RD3 has the **highest** capacity and HTC, but also has the highest air ΔP – this is the 3mm coil <u>used in</u> <u>subsequent tests</u>

Thermal-Hydraulic Characteristics

RD3T1S1 used for this frost testing is suboptimal – Better designs exist

- Frost accumulation increases thermal resistance and restricts airflow, degrading capacity during runtime, but also:
- Frost must be cleared periodically, consuming additional energy that doesn't result in useful heat transfer to the conditioned space
- What is the value of changing frost/defrost time on this penalty?

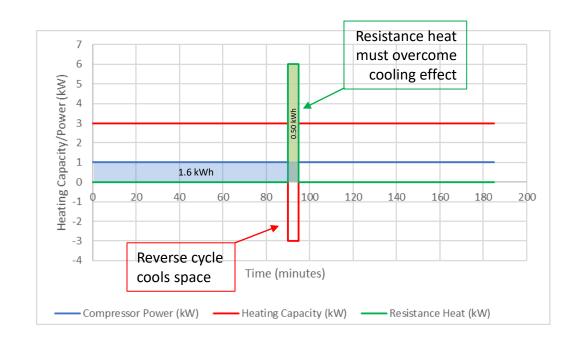

Defrosting Energy Impacts (cont.)

- Frost Time: 90 minutes
- Defrost Time: 5 minutes
- COP: 3

No Defrost	Defrost – fan on	Defrost – fan off				
4 50	2.00	4 50				
1.58	2.08	1.58				
4.75	4.75	4.5				
3	2.28	2.85				
24% lower effective COP						
	Defrost 1.58 4.75 3	Defrost fan on 1.58 2.08 4.75 4.75 3 2.28				

5% lower effective COP

Optimized Thermal SYSTEMS

Defrosting Energy Impacts (cont.)

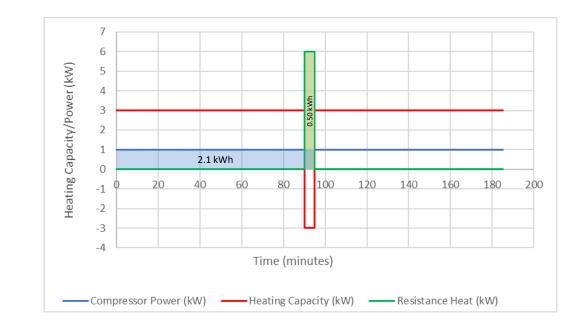

12

- Frost Time: 120 minutes
- Defrost Time: 5 minutes
- COP: 3

	No Defrost	Defrost – fan on	Defrost – fan off			
Electricity In (kWh)	2.08	2.58	2.08			
Heat Delivered (kWh)	6.25	6.25	6			
Effective COP	3	2.42	2.88			
t t						
19% lower effective COP						

4% lower effective COP If a coating can extend the runtime from 90 to 120 minutes, it may result in ~20% decrease in defrost penalty and 1-6% increase in effective COP

Effective COP- Frost Mitigation vs Cycle Improvement

With fan on during defrost:

				COP Improvement				
Heating Interval (mins)	Defrost Interval (mins)	Defrost "ratio"	0%	2.00%	4.00%	6.00%	8.00%	10.00%
60	5	0.0833	2.06	2.10	2.13	2.16	2.19	2.23
90	5	0.0556	2.32	2.36	2.40	2.44	<u>2.48</u>	2.52
120	5	0.0417	▼ <u>2.46</u>	2.51	2.55	2.60	2.64	2.68
150	5	0.0333	2.56	2.61	2.65	2.70	2.74	2.79
180	5	0.0278	2.63	2.67	2.72	2.77	2.82	2.87
210	5	0.0238	2.67	2.72	2.77	2.82	2.87	2.92

Extending heating interval from 90 to 120 mins is as good as improving base COP by 7%!

Fan off during defrost:

				COP Improvement				
Heating Interval (mins)	Defrost Interval (mins)	Defrost "ratio"	0%	2.00%	4.00%	6.00%	8.00%	10.00%
60	5	0.0833	2.77	2.82	2.88	2.94	2.99	3.05
90	5	0.0556	2.84 —	<u>2.90</u>	2.96	3.01	3.07	3.13
120	5	0.0417	2.88	2.94	3.00	3.05	3.11	3.17
150	5	0.0333	2.90	2.96	3.02	3.08	3.14	3.19
180	5	0.0278	2.92	2.98	3.04	3.09	3.15	3.21
210	5	0.0238	2.93	2.99	3.05	3.11	3.16	3.22

Extending heating interval from 90 to 150 mins is as good as improving base COP by 2%

Optimized Thermal SYSTEMS

Frost Testing

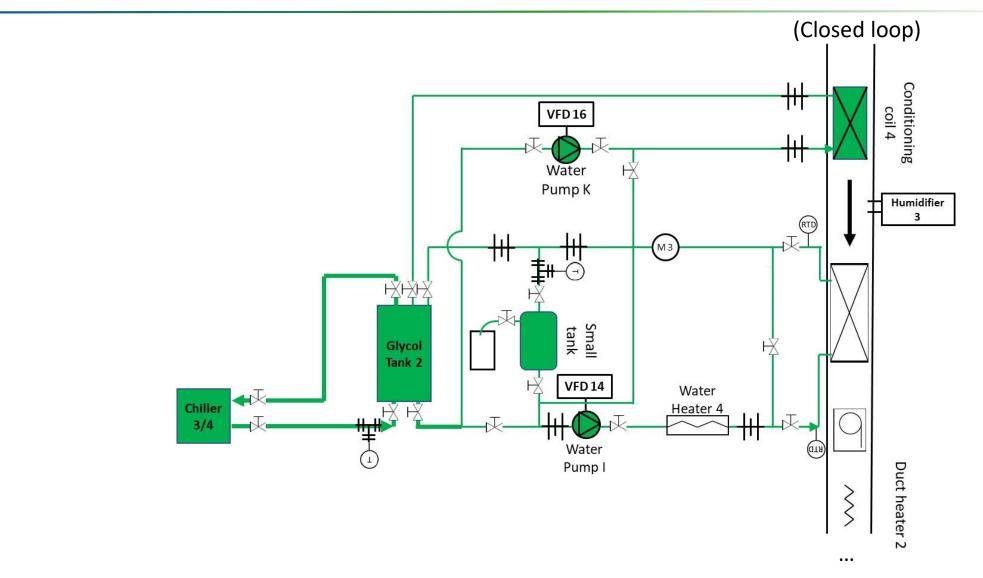

- Frost accumulation is a critical concern for heat pumps. Small diameter tube HXs
 often have smaller fin spacing → more sensitive to frost than larger-diameter
 counterparts
- Past work suggests that coatings may delay or help shed frost growth in some conditions
 - Superhydrophobic coatings may reduce condensate retention before frost growth and/or accelerate frost or water shedding during defrosting
- Coated coils tested with NEI's NANOMYTE[®] SuperCN which is highly hydrophobic and designed specifically for metal substrate
- 4 Testing Configurations:
 - 3mm uncoated
 - 3mm coated
 - 5mm uncoated
 - 5mm coated

Coil #	Surface Area	Envelope Volume	Internal Volume	Material Mass	Fin Spacing
-	mm²	mm ³	mm ³	kg	mm
3mm	1.85E06	8.97E05	8.56E04	0.572	0.79
5mm	1.83E06 (↓1.1%)	1.44E06 (个61%)	1.45E05 (个69%)	0.770 (个35%)	1.36 (个72%)

Effect of Coatings

3mm coils

Effect of Coatings (cont.)

5mm coils

25

Percent Improvement under each frost test condition

3mm					
Frost Test	% Improvement Range				
1	-6 to 80				
2	-8 to 538				
3	365 to 523				
4	125 to 185				
5	165 to 290				
8	58 to 207				
9	6 to 291				

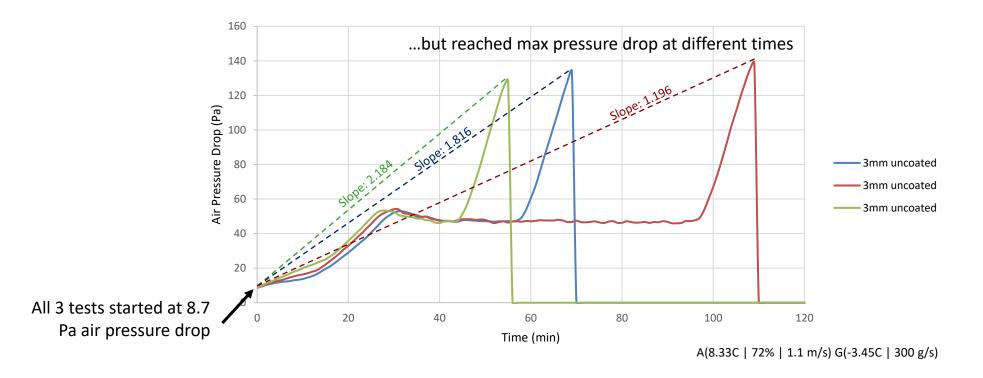

5mm					
% Improvement Range					
23 to 65					
108 to 182					
76 to 174					
109 to 193					
77 to 89					
-31 to -6					
-26 to 34					

December 11, 2021

Repeatability

- Frost tests are highly variable
- Small changes in operating conditions can produce very different results

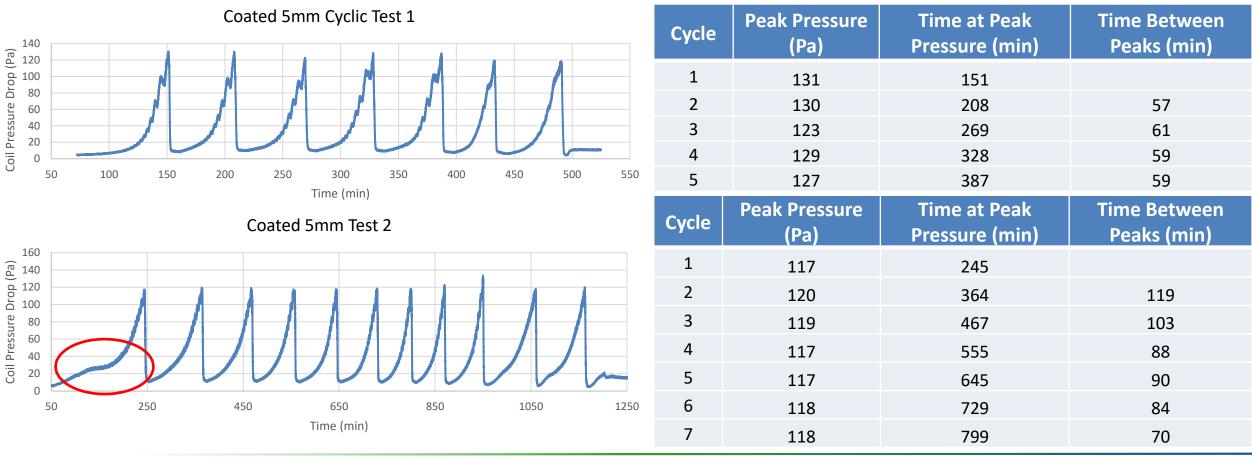

Optimized Thermal S Y S T E M S

Cyclic Testing

- Ideally, tests should be repeated through multiple cycles because coil usually doesn't return to 100% dry state
- Some test conditions are more sensitive to repeatability issues

December 11, 2021

Optimized Thermal

This document contains information proprietary to Optimized Thermal Systems, Inc. (OTS). This document and the contained information cannot be used, copied, transmitted, in full or in part, without prior written authorization of OTS.

Conclusions/Discussion

- 3mm designs offer clear advantages over larger diameters, even 5mm
- Frost tests were performed to begin to understand differences in frost development for such small diameters
- 3mm has smaller characteristic lengths and frosts degrades performance more quickly
- Superhydrophobic coatings may be helpful in mitigating frost effects
 - Other coatings exist and may perform better potential for future work
- Frost tests are highly variable, repeated cyclic tests and tightly controlled conditions are required
 - This type of testing allows for qualitative study and materials screening
 - System-level testing is gold standard for determining real world impacts
